

## **Dr. Keroack's Research on Abortion and Ultrasound**

Dr. Eric Keroack, MD OB/GYN, completed a study based on the clients we provided ultrasounds to over two years and shares his results with us.

- 97.5% of ALL MISCARRIAGES occurred before 9 weeks gestational age.
- If you include the 12 Non-Pregnant clients with the First Trimester Group A (seeking evaluation in "early pregnancy")...the AVOID ABORTION status becomes 51 out of 263 clients or 19.4%.
- These facts suggest that 185/263 clients in 5-8.9wk age-group will NOT CHOOSE ABORTION...70.3%. Thus only 29.7% of women less than 9 weeks gestation ultimately chose to abort their early pregnancy after viewing an Ultrasound. This underscores the potential value in continuing to do early U/S at AWC.
- Women attending our facilities while considering abortion had a higher birth rate than those intending to carry their pregnancy...63.5% vs. 55%!
- Our Abortion Vulnerable clients seen after 9 weeks gestation had a "change of decision" rate of 83%---143/172 clients...and only a 16.2% abortion rate---28/172 clients.

Perhaps this sheds some light upon the "push" by the Abortion Industry for women to seek "early abortions"...well before the Natural Selection Process for Miscarriage is established! It also might explain the "justification" of bypassing the costly use of pre-abortion Ultrasound in poor women who would rather not pay for this service!
